# The Ford-Fulkerson Algorithm

Algorithm. Given  $(G, s, t, c)$

start with  $f(u,v)=0$  and  $G_f = G$ .

while exists an augmenting  $s$ - $t$  path in  $G_f$

find a bottleneck

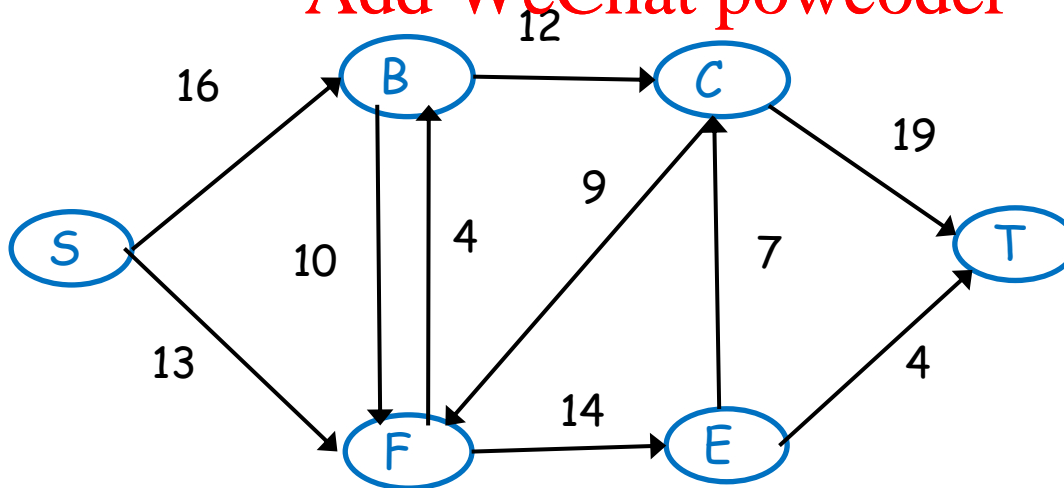

augment the flow along this path

update the residual graph  $G_f$

# Reduction

Formally, to reduce a problem  $Y$  to a problem  $X$  (we write  $Y \leq_p X$ ) we want a function  $f$  that maps  $Y$  to  $X$  such that:

Assignment Project Exam Help

- $f$  is a polynomial time computable
- $\forall$  instance  $y \in Y$  is solvable if and only if  $f(y) \in X$  is solvable.

# Solving by reduction to NF

1. Describe how to construct a flow network
2. Make a claim. Something like "this problem has a feasible solution if and only if the max flow is ..."
3. Prove the above claim in both directions

# Discussion Problem 1

At a dinner party, there are  $n$  families  $a_1, a_2, \dots, a_n$  and  $m$  tables  $b_1, b_2, \dots, b_m$ . The  $i$ -th family  $a_i$  has  $g_i$  members and the  $j$ -th table  $b_j$  has  $h_j$  seats. Everyone is interested in making new friends and the dinner party planner wants to seat people such that no two members of the same family are seated at the same table. Design an algorithm that decides if there exists a seating assignment such that everyone is seated and no two members of the same family are seated at the same table. What would be a seating arrangement?

## Discussion Problem 2

A company has  $n$  locations in city  $A$  and plans to move some of them (or all) to another city  $B$ . The  $i$ -th location costs  $a_i$  per year if it is in the city  $A$  and  $b_i$  per year if it is in the city  $B$ . The company also needs to pay an extra cost,  $c_{ij} > 0$ , per year for traveling between locations  $i$  and  $j$ . We assume that  $c_{ij} = c_{ji}$ . Design an efficient algorithm to decide which company locations in city  $A$  should be moved to city  $B$  in order to minimize the total annual cost.

# Circulation

Given a directed graph in which in addition to having capacities  $c(u, v) \geq 0$  on each edge, we associate each vertex  $v$  with a supply/demand value  $d(v)$ . We say that a vertex  $v$  is a demand if  $d(v) > 0$  and a supply if  $d(v) < 0$ .

<https://powcoder.com>

Add WeChat powcoder

# Necessary Condition

For every feasible circulation  $\sum_{v \in V} d(v) = 0$

# Circulation with Demands and Lower Bounds

We are given a directed graph  $G=(V, E)$  with a capacity  $c(e)$  and a lower bound  $0 \leq \ell(e) \leq c(e)$  on each edge and a demand  $d(v)$  on each vertex.

Assignment Project Exam Help

# Circulation with Demands and Lower Bounds

$$L(v) = f_0^{\text{in}}(v) - f_0^{\text{out}}(v)$$

$$d'(v) = d(v) - L(v).$$

# Circulation with Demands and Lower Bounds

Add WeChat *new G'* powcoder

Claim: there is a feasible circulation in  $G$  iff there is a feasible circulation in a new graph  $G'$ .

# Circulation with Demands and Lower Bounds

Summary: given  $G$  with lower bounds, we:

subtract lower bound  $\ell(e)$  from the capacity of each edge

<https://powcoder.com>

subtract  $L(v)$  from the demand of each node

Add WeChat powcoder

solve the circulation problem on this new graph to get a flow  $f$ .

add  $\ell(e)$  to every  $f(e)$  to get a flow for the original graph

# Discussion Problem 4

Given the network below with the demand values on vertices and lower bounds on edge capacities, determine if there is a feasible circulation in this graph.

## Discussion Problem 5

CSCI 570 is a large class with  $n$  TAs. Each week TAs must hold office hours in the TA office room. There is a set of  $k$  hour-long time intervals  $I_1, I_2, \dots, I_k$  in which the office room is available. The room can accommodate up to 3 TAs at any time. Each TA provides a subset of the time intervals he or she can hold office hours with the minimum requirement of  $l_j$  hour per week, and the maximum  $m_j$  hours per week. Lastly, the total number of office hours held during the week must be  $H$ . Design an algorithm to determine if there is a valid way to schedule the TA's office hours with respect to these constraints.
